ExecuScribe Partners with BayScribe for Web-based, Electronic Physician Documentation Software and Dictation System Technology

Partnership gives ExecuScribe customers more flexibility, efficiency and lower dictation technology costs.

Rochester, NY (June 4, 2010) – [ExecuScribe](#), a leading medical transcription services provider and [Inc. 500 Fastest Growing Company](#), today announced a business partnership with [BayScribe](#), the industry's first virtual dictation and transcription technology platform. Through the partnership, ExecuScribe customers receive state-of-the-art dictation technology, more flexible physician documentation capture options and an easy migration path to EHR-based template reporting. Furthermore, by implementing the BayScribe platform ExecuScribe customers reduce system costs and virtually eliminate the need for technology support for dictation devices. The announcement was made by Linda Yaniszewski, President of ExecuScribe.

"We are committed to finding and deploying technology tools that make it easier for our customers to support their physicians while also moving forward into EHR environments," mentions Yaniszewski. The BayScribe dictation technology platform offers mobility, flexibility and a practical bridge to EHR adoption including the ability for physicians to dictate on mobile devices. Physician feedback regarding the use of iPhones, Blackberries and Windows Mobile Devices in conjunction with the BayScribe platform has been particularly favorable.

"Physicians don't instantly transition from dictating everything to typing, pointing and clicking in the EHR, as evidenced by the EHR adoption rates," mentions Steven Bonney, Vice President, Business Development for BayScribe. Instead, moving physicians into template-based documentation should be a slow, well-planned migration process focused on the physician's experience and natural workflow.

ExecuScribe concurs and works closely with clients to seamlessly evolve physician documentation practices from traditional dictation and transcription to back-end speech recognition and front-end voice recognition, while continuing to provide reliable, high quality documentation editing services. "Whether hospitals utilize their own, internal transcription staff, completely outsource to ExecuScribe, or use a blended services approach, we are committed to helping them continually measure and improve their clinical documentation capabilities," concludes Yaniszewski.
